

Architecture flow data-flow

1. <https://github.com/input-output-hk/cardano-db-sync>
2. <https://github.com/input-output-hk/cardano-graphql>
3. <https://www.npmjs.com/package/@cardano-graphql/api-cardano-db-hasura>

The data returned by Cardano-graphql API is sourced from a PostgreSQL database produced by cardano-db-sync-extended with runtime query translation and results mapping performed by Hasura, Cardano GraphQL exposes a domain model and provides controls to limit access, prior to delegating the query

For kEVM node - data is sourced from unix storage that modified for LevelDB schema
